Tree Facts

- In the late Devonian period (during the evolution of terrestrial plants), there was a 'wood crisis'. Trees became abundant, took CO2 out of the air, and caused an ice age, simply because the fungi that eventually would decompose dead wood & return the CO2 to the air hadn't evolved yet.

- An average tree is made up of 99% dead cells, only around 1% of it is alive at any time, consisting of the leaves, root tips, and phloem (a thin layer of under bark that acts as a food delivery system).

- The Manchineel tree, native to Florida is considered the most poisonous tree in the world. It causes painful blisters if you stand under it during rain, blinds you if the smoke from its burned wood touches your eyes, can poison water with its leaves and will cause death if you eat its fruits.

- Da Vinci's Rule of the Trees" ("all branches of a tree … put together are equal in thickness to its trunk.") appears to be true.
